Challenges Encountered

1. **Backend Integration Issues**

   - The dilemmas involved administrating roles for user functions as well as for the admin dynamically
   - Making sessions work and having a notification system was difficult. Insertion of notification and session management had to be managed well.
2. **Frontend and Backend Coordination**

   - The major tasks involved a lot of HTML templates as well as backend debugging to get the HTML templates working with the backend logic.
   - rendering headers and footers Rendering of the top and bottom of any page on the server created inconsistencies.

What Went Wrong

1. **Communication Issues**
   - This was tthe first collaboration ever done on github which was not straitened out which caused miscommunication.
2. Dividing one page for multiple user functions made it very challenging to interact and debug the page

Improvements for Next Time

1. **Documentation and Planning**
   - To Maintain A Proper Record of the Feature By having proper diagrams and documents over evolving features.
2. **Iterative Development**
   - Implement an integrated system after conducting the individual assessments of each evolving feature.
